Reflection

Some things that went well were the creation of the hash table class and the other parts of it. It was also easy to understand the concept of how it works and the overall process of how it added the salt then hashed it and re-ran the same function with the same string (if the username was correct) to check and see if they logged in correctly. The entry functions were easy and made sense. The remove a user function had its moments with how to navigate but overall wasn't too bad. The instructions worked well and helped me understand the concept behind the cyber security part and was good to learn as that's my concentration, so I'd say this project was my favorite. My partner did well on this and helped a lot with the understanding of it in the end we tried different methods and ended up working on the main functions and got it to work perfect, but the work was very well divided and we worked great together.

Best,
